

## cold-welding-adhesive SK 15

- cold-welding-adhesive SK 15 for the cold welding of Raipolen handrails F 408/ C 408 – Conturline (40 x 8 mm) and the endcaps EK 408/ EKC 408 - Conturline
  - easy and fast fitting of the endcaps
  - strong and durable welding connection

- **recommendation:**

We recommend the cold-welding-adhesive SK 15 for an easy and safe fixing of the endcaps EK 408/ EK 408 - Conturline to the handrail profile F 408/ C 408 - Conturline (40 x 8 mm). So you get a perfect, clean and durable finish of the handrail.

- **process:**

The open side of the fitted handrail should be 15 – 20 mm longer than the metal girder and cutted off flat (in a right angel to the longitudinal axis). The inner side of the handrail profile should be well coated, the insertion part of the endcap should only be slightly coated with the special adhesive SK 15. The insertion area of the endcap now needs to be inserted into the handrail profile. After a time of 24 hours, a strong and durable unit of handrail and endcap is created by a cold welding process. Please take a look at the technical data sheet.

- **addition:**
